

README

HTML

div tags: the most important tag that I used is div tag. I used div tags to present the reservation block and cancellation block.

form tags: In the two div tag, I used form tag to let the manager input the information of reservation or cancellation.

button tag: there is a "Reservation List" button in the bottom of the homepage. When clicking the button, a table containing the detailed information will be shown directly on the page.

CSS

I wrote the selectors in the styles.css file. This selectors set the format of different tags and make them beautiful.

Javascript

local storage: the most important thing of javascript in this application to store the information.

Initialize(): this function checks whether local storage is storing the information of this application. If not, the function will set the original information of every seats.

Book() and Cancel(): these two functions store or remove the reservation information from the local storage.

RList(): generates the table which stores the detailed information of reservation.

Additional features

The reservation list will be more beautiful.
